# ABSTRACT:

Audio classification stands out as a crucial application from speech recognition to environmental sound detection and biometric identification. This project aims to use an Artificial neural network, a machine learning algorithm, to identify and classify audio data into different classes. Urbansound8k dataset is used for training, Mel-frequency cepstral coefficients, and ReLU activation function has been used. Finally the trained model can classify the given audio file into its class.

## Conclusion:

our project on audio classification using artificial neural networks (ANN) demonstrated the effectiveness of deep learning techniques in accurately categorizing audio signals. Through careful data preprocessing and model training, we achieved a significant accuracy rate, showcasing the ANN's capability to learn complex patterns in audio features. This approach has promising applications in various fields, including music genre classification, speech recognition, and environmental sound analysis
